

Legal Tech Navigator Report

Best-fit legal technology for your team

Clario 
Intelligent resourcing for
in-house legal teams

Discover, compare and select legal technology with confidence

Clario's **Legal Tech Navigator** is one of the most comprehensive databases of in-house legal technology providers available today. Built for Australian in-house legal teams, it maps and analyses **600+** legal technology vendors, helping lawyers navigate an increasingly complex and crowded market.

The Navigator:

- Is vendor-agnostic, enabling teams to discover, assess and select legal technology with confidence.
- Combines guided needs discovery, a curated view of the legal tech market, structured evaluation scorecards and decision-ready reporting.
- Allows lawyers to filter and compare vendors across practical criteria including functionality, user segment, maturity, ease of purchase, deployment model and more.
- Provides a Legal Tech Value Score, a structured, data-informed way to compare tools based on market adoption, product maturity, AI capability, geographic reach and data completeness.
- Reduces the two biggest barriers to action: market overwhelm and perceived implementation risk.
- Delivers a clear shortlist with supporting rationale, an evidence-based comparison of options and a defensible recommendation that can be confidently taken to internal stakeholders.

Key Considerations

The legal technology platforms identified through the Clario Legal Tech Navigator align strongly with the requirements captured in your search. While each tool addresses the core capabilities prioritised in the filters, they differ in emphasis, implementation approach and operational focus.

Different tools prioritise different operational outcomes

While each platform addresses the core functionality identified in the Navigator filters, they focus on different aspects of legal service delivery. Some tools emphasise workflow automation and structured legal intake, while others focus on collaboration or broader legal operations management.

Implementation effort varies across platforms

Legal technology platforms differ significantly in the level of configuration, integration and change management required for successful deployment. Some tools are designed for relatively rapid implementation, while others provide broader capability but require a more structured rollout.

Usability and adoption remain critical success factors

Technology adoption within legal teams often depends on how easily lawyers and business users can integrate the platform into their daily workflows. Platforms that simplify legal intake, automate routine tasks or improve visibility of legal work can deliver faster operational impact.

AI capabilities are becoming embedded in legal technology

Many modern legal technology platforms now include AI-powered features to support workflow automation, document analysis and legal knowledge retrieval. However, the maturity and practical application of these capabilities vary across products.

Navigator Insight

In-house legal teams are increasingly prioritising technologies that reduce administrative workload and allow lawyers to focus on higher-value legal work. Platforms that structure legal demand, automate workflows and improve visibility of legal work are currently among the fastest growing areas of legal technology adoption.

What This Means for Your Evaluation

All three shortlisted tools represent credible options based on your requirements. The most suitable platform will depend on your organisation's priorities, the level of operational change your team is prepared to undertake, and the desired balance between capability, usability and implementation effort. The comparison sections that follow provide a deeper assessment of how each tool performs across these dimensions.

How to use this report

This report is designed to support confident, evidence-based legal technology decisions.

Step 1: Confirm your requirements

Review your problem statement and ensure the Navigator filters reflect your team's priorities, constraints and operating context.

Step 2: Review the shortlist

Examine the three recommended tools identified as the best match for your requirements.

Step 3: Understand the Legal Tech Value Score

Each tool has been assessed on capability, maturity, usability, implementation complexity, security and overall fit.

Step 4: Compare the options

Use the side-by-side comparison to identify key differences, trade-offs and potential risks between the shortlisted tools.

Step 5: Review the recommendation

The recommendation highlights the strongest overall option and the rationale behind the selection.

Step 6: Align stakeholders and proceed

Share the report with IT, security, finance and procurement to support demos, pricing discussions and final vendor selection.

Comparing your prioritised legal tech tools

Next steps...

Confirm your preferred shortlist and select 2–4 vendors to progress. Provide each vendor with the same brief: your problem statement, key requirements, timeline, stakeholder group and any constraints such as security, integrations or data residency. Request a structured demonstration aligned to your use cases and ask vendors to share supporting materials in advance, including their pricing model, implementation approach, security documentation, client references and a sample contract. Using a consistent agenda across demonstrations makes it much easier to compare options objectively and reach a confident decision.

How Clario Can Support

Clario can support this stage end-to-end. We can coordinate vendor introductions, help design the demo script, attend demonstrations with your team and capture outcomes against the evaluation criteria. We can also assist with procurement by refining your requirements pack, running a light-touch RFP if required, reviewing vendor responses and supporting commercial and contractual negotiations. This keeps the process moving, reduces risk and ensures the final decision is well supported and defensible.

Where a commercial product does not fully meet your needs, Clario can also help design and build custom AI agents and workflow solutions tailored to your legal team. This approach can deliver targeted capability without the cost and complexity of large enterprise platforms, allowing teams to implement practical AI solutions aligned to their processes and budget. Call to action.

If you would like support progressing the shortlist, coordinating vendor demonstrations or exploring a custom AI solution, contact the Clario team to discuss the next step in your legal technology journey.
